

Nonlinear Underwater Acoustics
B. K. Novikov, O. V. Rudenko, V. I. Timoshenko
Translated by Robert T. Beyer
Translation published in 1987; Originally Published in 1981

CONTENTS

Preface

List of symbols and abbreviations

Chapter 1. Parametric sound sources and receivers

Chapter 2. Methods of calculation of Nonlinear interactions in sound beams

Small parameters used in the calculation of wave interactions

Solution of the equations of hydrodynamics by the method of successive approximations

Calculation of the secondary field by the Green's function method: The Westervelt formula

Estimates of the basic characteristics of parametric radiators by means of nomograms

The method of slowly changing in profile and the simplified equations of nonlinear acoustics

Chapter 3. Nonlinear interaction of plane waves

The Burgers equation: Propagation of a harmonic signal

Interaction of waves for weak nonlinearity

Interaction of intense acoustic waves

Chapter 4. Method of the parabolic equation and basic results of linear diffraction theory

Diffraction of axisymmetric Gaussian beams

Calculation of beam patterns in the parabolic approximation

Diffraction of an axisymmetric beam in the case of a uniform distribution of the amplitude at the radiator

Diffraction of focused and defocused Gaussian beams

Diffraction of plane (two-dimensional) beams

Chapter 5. Parametric sound radiators with nonfracting beams of pump waves

General scheme of calculation and solution for an arbitrary distribution of amplitude and phase on the pump transducer

The beam pattern

Process of formation of parametric radiation in the field of nondiffracting pump waves

Chapter 6. Calculation of different regimes of operation of the parametric radiator

Effect of diffraction of undamped pump waves on the formation of the difference-frequency wave

Calculation of parametric radiators in media with dissipation

Effect of dispersion on the characteristics of the parametric radiator

Parametric radiator with focused and defocused pump beams

Parametric radiators of low-frequency broadband signals

Region of applicability of the radiator model considered

Chapter 7. Parametric receiving arrays

Noncollinear interaction of plane acoustic waves

Operation of a parametric receiving ray

Quasi-optical approximation in analyses of the PARRAY: Effects of nonlinearity, dissipation, and diffraction

Chapter 8. Operation of parametric radiators at high intensities of the pump waves

Calculations of the generation of low-frequency harmonics and features of the beam pattern structure

The shape of the low-frequency waveform in the far field of high-intensity pump waves

Numerical results

Chapter 9. Thermal opto-acoustic arrays

Excitation of plane waves, transfer functions

Acoustic signals excited by individual sound pulses in homogeneous and optically inhomogeneous media

Stepwise approach and the effect of diffraction on opto-acoustic pulses
Moving opto-acoustic arrays

Chapter 10. Construction features of parametric underwater devices

Signal formation circuits

Construction features of the elements of parametric arrays

Effect of nonlinearity of active materials on the characteristics of parametric arrays

Chapter 11. Experimental investigations and testing of parametric arrays

Features of underwater acoustic measurements of the characteristics of nonlinear arrays

Test station for parametric devices

Distribution of primary and secondary fields on the axis of a parametric array

Beam patterns

Phase characteristics

Amplitude-frequency characteristics

Amplitude and phase-amplitude characteristics: Saturation of the parametric radiator

Basic characteristics of parametric receivers

Effect of the properties of the medium on the characteristics of the parametric array

Basic control of nonlinear arrays

Chapter 12. Parametric apparatus and the regions of their use

Measurement radiators of the type NAI

Measurement parametric receiving arrays

Receiving parametric arrays

Parametric apparatus for transmission of broadband information

Nonlinear underwater sound apparatus for active sonar

Parametric fathometers and apparatus for recording the bottom profile

Parametric sonars and apparatus for ocean geolocation

Conclusion

Appendix. Use of nomograms for calculation of the characteristics of a parametric radiator

Preface

Nonlinear phenomena, whose investigation is of interest for the solution of applied problems of modern underwater sound, are quite diverse in their physical nature. In their number we include cavitation, noise generation, acoustic streaming, and a series of other phenomena the description of which requires an account of the nonlinear terms in the equations of hydrodynamics. In recent years, there has been a great deal of attention paid to problems relating to nonlinear acoustics. The typical nonlinear effects—the distortion of a profile and the spectral composition of signals—are governed by the violation of the principle of wave superposition, which is common for all nonlinear problems.

Nonlinear wave effects are observed in the propagation of blast waves in the ocean. However, there is some difference between signals excited by electromechanical transducers and by blasts. The former depend on well-controlled parameters and allow us to carry out accurate spectral measurements, while pulsed blast signals are not, as a rule, reproduced experimentally, and measurements with their help yield lower accuracy. Therefore, effects due to an increase in the intensity of waves provided by acoustic methods are of interest at the present time.

The use of coherent acoustic signals of high intensity allows us not only to increase the range and resolutions of sonars but also to improve a number of other parameters of underwater sound apparatus.

At high levels of radiation, new effects appear which do not, in principle, exist in linear acoustics. Some of these effects are, in most cases, undesirable (such as, for example, the nonlinear damping and limitation of the signal level in water); many others, on the other hand, can be used to create new types of underwater sound apparatus.

The results of theoretical and experimental investigations of the interaction of nonlinear waves have been set forth in numerous papers and are correlated in monographs by R.T. Beyer, L.K. Zarembo and V.A. Krasil'nikov G.A. Ostroumov, and O.V. Rudenko and S.I. Soluyan. These works serve as a reliable foundation for practical applications. The annual number of publications on problems connected with the subject exceeded 250 in 1977. A significant number of publications have been devoted to the use of parametric arrays and instruments in underwater sound.

The information discussed in this increasing stream is more complicated in that investigators use different models and methods of calculation, and they publish experimental results carried out under strongly differing conditions and over different ranges of variation of the parameters. To a significant degree, this is due to the complexity of the investigated processes.

We call attention to the fact that an attempt is made in this book to consider the basic assumptions of nonlinear wave theory as applied to the solution of the problems of broadband directed radiation and detection of underwater signals from a single position.

The contemporary state of problems of the construction, application, and use of a new type of underwater sound apparatus—the nonlinear parametric apparatus is also set forth in this book.

The scientific achievements and the results of the development of nonlinear parametric receiving and transmitting arrays as well as underwater sound apparatus in which these arrays are used are correlated in this book. Necessary information on the interactions of one-dimensional waves is developed, and the basic results of the quasi-optical approximation of linear diffraction theory are given. A universal theory of parametric arrays is presented that allows us to investigate their characteristics with sufficient accuracy. Analytic relations have been obtained by the authors on the basis of the solution of nonlinear equations describing the behavior of acoustic beams in the quasi-optical approximation. Results have been obtained from these solutions in specific cases and calculated within the framework of the well-known models of Westervelt, Berktag, and others having limited regions of application.

Considerable space is given in this book to problems of distant, contact-free excitation of sound by means of the effective thermo-optical demodulation of light radiation in the surface layer of water.

Analysis of different working regimes of nonlinear underwater apparatus has been carried out with account of the real properties of the medium. A comparison is given of the theoretical and experimental data over the spatial distributions, frequency, amplitude, and phase characteristics of parametric transmitters and receivers. For convenience of engineering calculations, nomograms have been constructed that allow a great simplification in choosing parameters for the nonlinear arrays. A series of enlarged nomograms for the near, far and intermediate zones of the parametric array has been placed in the Appendix. The characteristics of a specific parametric apparatus are also given there.

The features of construction are developed, and the basic characteristics of foreign and domestic parametric arrays are given; small-size broadband measuring transmitters and receivers for tank and test stations, precision sonars, parametric fish detection apparatus, underwater sonars for shelf zones parametric apparatus for the transfer of broadband information in underwater sound channels, parametric Doppler sonars and acoustic recorders, parametric apparatus for geolocation acoustic cartography through a water layer, and so on.

The Conclusion and Chapter 1 were written by O.V. Rudenko and V.I. Timoshenko; Chapters 2, 4, 5, 8 and 9 by O.V. Rudenko; Chapters 3, 6, 7 and the Appendix by B.K. Novikov; Chapters 10,11 and 12 by V.I. Timoshenko.

The authors express their gratitude to C.A. Poyarkov, T.N. Kutsenko, and L.J. Timoshenko for their help on the preparation of the book.

Comments and remarks on the content of the book will be gratefully received by the authors.
