

# **Introduction to the Theory of Sound Transmission With Application to the Ocean**

C. B. Officer  
Published 1958

## **Contents**

### **Chapter 1. Fundamental Relations**

Components of Stress  
Components of Strain  
Stress-Strain Relations  
Equations of Motion  
Fundamental Solution of the Wave Equation  
  
Adiabatic and Isothermal Condition and the  
Velocity of Sound in Sea Water  
Relations for Energy, Energy Density, Energy  
Flow, and Intensity in Terms of Density,  
Pressure, and Particle Velocity  
Relations for Particle Displacement, Particle  
Velocity, Dilatation, and Stress in Terms  
of Velocity and Displacement Potential  
Unit of Measurement of Intensity, the Decibel  
  
Waves of Finite Amplitude  
Shock Fronts

### **Chapter 2. General Theory**

Development of Solution in Terms of Rays  
Ray Characteristics for Velocity a Function of One  
Space Coordinate Only  
Ray Characteristics for a Constant Velocity Gradient  
  
Development of Solution in Terms of Normal Modes  
Normal-mode Solution in Problems with More Complicated  
Wave Equations  
Refraction of a Dispersive Wave Train

Boundary Conditions

### **Chapter 3. Transmission in Shallow Water**

Ray Solution  
Reflection of a Pulse  
Surface Image Interference  
Normal Incidence to One and Two Boundaries  
Normal-mode Solution

### **Chapter 4. Transmission in Deep Water**

Ray Solution  
Normal-mode Solution  
Near-surface Transmission, Negative Velocity Gradient  
Near-Surface Transmission, Positive Velocity Gradient  
Overlying a Negative Gradient

### **Chapter 5. Reflectivity**

Formal Solution, Point Source in the Vicinity of a Plane  
Boundary  
Evaluation of the Resultant Integral in the Limit of High  
Frequencies  
Evaluation of the Resultant Integral for Long Ranges and  
for  $c_2 > c_1$   
Evaluation of the Branch-line Integral from the Normal-mode  
Solution of Chap. 3

Normal Incidence to a Rapid Change in Velocity  
Reflection from an Elastic Medium  
Normal Incidence to a Corrugated Boundary  
Reflection from a Porous Medium  
Reflection from a Boundary for Which the Boundary Condition  
is Continuity of Acoustic Impedance

Reflection from Three Layers  
Horizontal Coupling to a Wave Guide

Interpretation of Echo Sounding Records  
Interpretation of Geophysical Reflection and Refraction Profiles

## Chapter 6. Attenuation

Absorption, Viscous Fluid  
Absorption, Heat Conduction  
Propagation in a Porous Medium

General Theory for Scattering and Diffraction  
Scattering from a Small Object  
Diffraction  
Reception to a Linear Array

*Index*

---

## Preface

It has been my intention in this book to give an introduction to the theory of sound transmission. One might consider any acoustic problem as consisting of some sort of source, transmission, and reception. The transmission itself is, of course, an important and integral part of the whole; this is the portion which is covered here. The level of the book is commensurate with that of a senior undergraduate-first-year graduate course. I have attempted to give the theory in such a manner and to such a degree that following this a reader might feel at ease with the published literature in the field. My specific applications of the theory have been to a description of sound transmission in the ocean. Wherever possible I have given the physical explanations of the theoretical results; this I feel is an important part of a thorough understanding of the theory.

I hope that the book may be of interest to those engaged in various aspects of acoustics and geophysics and particularly to those who are entering into or desire to become acquainted with this subject.

The mathematics involved in the various derivations have been carried through in some detail. For those problems involving the evaluation of integrals, the integrals have been reduced to a familiar form or to a convenient tabulated form. On the other hand, no theory or proof of the various mathematical concepts that are used, such as Fourier integrals, is given. On this account the reader may wish to refer to or study an appropriate mathematics text from time to time.

References to the pertinent books and journal articles are covered in a particular chapter are given at the end of the chapter. Specific reference within each chapter has been avoided. Of the more recent theoretical developments, however, special mention should be given to C. L. Pekeris for the normal-mode type of solution. Only general mention is given to experimental work. This has been intentional.

I should like to express by thanks to the Rice Institute and the Woods Hole Oceanographic Institution for their generous policy of allowing an individual to follow the pursuits of his interest and to the Office of Naval Research and the Bureau of Ships, U. S. Navy,

who have encouraged and supported in a number of ways the preparation of this book. I should also like to acknowledge the discussions that I have had at various times with Drs. J. B. Hersey, and A. D. Voorhis and Mr. A. C. Vine, Woods Hole Oceanographic Institution; Profs. M. Ewing, J. Nafe, and J. L. Worzel and Messrs. J. I. Ewing and G. H. Sutton, Lamont Geological Observatory, Columbia University; Prof. F. Press, Seismological Laboratory, California Institute of Technology, Drs. R. Frosch, and I. Tolstoy, Hudson Laboratories, Columbia University; and Dr. E. T. Miller, Houston Research Center, Humble Oil CO., on matters pertinent to this book. Messrs D. G. Harkrider, T. W. Lawhorn, and D. E. Miller, graduate students at the Rice Institute, have critically examined portions of the material covered in this book.
